## Chemical Equilibrium

## Introduction :

Equilibrium is a state in which there are no observable changes as time goes by. When a chemical reaction has reached the equilibrium state, the concentrations of reactants and products remain constant over time and there are no visible changes in the system. However, there is much activity at the molecular level because reactant molecules continue to from product molecules while product molecules react to yield reactant molecules. This dynamic situation is the subject of this chapter. Here we will discuss different types of equilibrium reactions, the meaning of the equilibrium constant and its relationship to the rate constant and factors that can effect a system at equilibrium.

## Section (A) : Properties of equilibrium, active mass Types of chemical reactions

The reaction which proceed in one direction only
(a) Precipitation reactions e.g
$\mathrm{NaCl}(\mathrm{aq})+\mathrm{AgNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{NaNO}_{3}(\mathrm{aq})+\mathrm{AgCl}^{-}$
(b) Neutralization reactions e.g.
$\mathrm{HCl}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{NaCl}(\mathrm{s})+\mathrm{H}_{2} \mathrm{O}$
(c) Reactions in open vessels with
one of the gaseous product

Reactions which proceed in both the direction. These are possible only in closed vessel e.g
(a) $\mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}(\mathrm{g})$
(b) $\mathrm{PCl}_{5}(\mathrm{~g}) \rightleftharpoons \mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})$

Types of chemical reactions

|  | Irreversible reaction |  | Reversible reaction |
| :---: | :---: | :---: | :---: |
| 1 | The reaction which proceeds in one direction (forward direction) only. | 1 | The reaction which proceed in both the direction under the same set of experimental conditions. |
| 2 | Reactants are almost completely converted into products. Products do not react to form reactants again. | 2 | Reactants form products and products also react to form reactants in backward direction. These are possible in closed vessels . |
| 3 | Do not attain equilibrium state. | 3 | Attain the equilibrium state and never go to completion. |
| 4 | Such reactions are represented by single arrow $\{\rightarrow\}$ | 4 | Represented by double arrow ( $\rightleftharpoons$ ) or ( $\rightleftarrows$ ) |
| 5 | Examples - | 5 | Examples:- |
| (a) (b) (c) | Precipitation reactions e.g. $\mathrm{NaCl}(\mathrm{aq})+\mathrm{AgNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{NaNO}_{3}(\mathrm{aq})+\mathrm{AgCl} \downarrow$ <br> Neutralization reactions e.g $\mathrm{HCl}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}$ | (a) | Homogeneous reactions- only one phase is present <br> (i) Gaseous phase- $\begin{aligned} & \mathrm{H}_{2}(\mathrm{~g})+\mathrm{l}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{~g}) \\ & \left.\mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}_{(\mathrm{g})} \text { [Birkland eyde process }\left(\mathrm{HNO}_{3}\right)\right] \\ & \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g}) \text { (Haber's process) } \end{aligned}$ <br> (ii) Liquid phase |
| (d) | $2 \mathrm{KClO}_{3}(\mathrm{~s}) \xrightarrow{\Delta} 2 \mathrm{KCl}(\mathrm{~s})+3 \mathrm{O}_{2}(\mathrm{~g})$ <br> Reactions in open vessel: <br> Even a reversible reaction will become irreversible if it is carried out in open vessel. | (b) | $\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{I})+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{I}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}(\mathrm{I})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$ <br> Heterogeneous reactions: More than one phases are present $\begin{array}{lc\|} \hline \text { present } \\ \mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{CaO}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g}) & \begin{array}{l} \text { Closed } \\ \text { vessel } \end{array} \\ \mathrm{NH}_{4} \mathrm{HS}(\mathrm{~s}) \rightleftharpoons \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g}) & \end{array}$ |

## State of Chemical equilibrium :

State of equilibrium means the balance of driving forces i.e. the factors taking the reaction in forward direction and the backword direction are balancing each other
The equilibrium state represents a compromise between two opposing tendencies.

- Tendency to minimise energy. - Molecules try to maximise entropy.

Resonance ${ }^{\text {a }}$
Educating for better tomorrow

[^0]
## In a reversible reaction like :

$$
\underbrace{R_{1}+R_{2}}_{\text {Reactants }} \rightleftharpoons \underbrace{P_{1}+P_{2}}_{\text {Products }}
$$

Initially only reactants are present. $R_{1}$ and $R_{2}$ combine to form $P_{1}$ and $P_{2}$. As soon as $P_{1}$ and $P_{2}$ are formed, they start the backward reaction. As concentrations of $R_{1}$ and $R_{2}$ decrease rate of forward reaction decreases and rate of backward reaction increases. Ultimately a stage is reached when both the rates become equal. Such a state is known as "Chemical Equilibrium" or "state of Equilibrium".

## At equilibrium :

(i) Rate of forward reaction $\left(\mathrm{r}_{\mathrm{f}}\right)=$ rate of backward reaction $\left(\mathrm{r}_{\mathrm{b}}\right)$ (dynamic nature)
(ii) All measurable parameters become constant with respect to time.

Types of equilibria on basis of physical state

Homogeneous equilibrium One phase in the system $\mathrm{H}_{2}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{HCl}(\mathrm{g})$

$$
\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{NO}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{SO}_{3}(\mathrm{~g})+\mathrm{NO}(\mathrm{~g})
$$

Heterogeneous equilibrium
More than one phase are present in system
$3 \mathrm{Fe}(\mathrm{s})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightleftharpoons \mathrm{Fe}_{3} \mathrm{O}_{4}(\mathrm{~s})+4 \mathrm{H}_{2}(\mathrm{~g})$
$2 \mathrm{Na}_{2} \mathrm{O}_{2}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\ell) \rightleftharpoons 4 \mathrm{NaOH}+\mathrm{O}_{2}(\mathrm{~g})$

## Characteristics of chemical equilibrium :

- The nature and the properties of the equilibrium state are the same regardless of the direction from which it is achieved. It can be achieved in both directions.
- Equilibrium is dynamic in nature.

It means that at microscopic level reaction has not stopped. It appears that no change is occuring but both the opposing reactions are proceeding at the same rate. So there is no net change.Thus equilibrium is not static in nature.

- A catalyst can alter the rate of approach of equilibrium but does not change the state of equilibrium. By using catalyst, the equilibrium can be achieved in different (more/less) time, but the relative concentrations of reactants and products are same irrespective of the presence or absence of a catalyst.
- Equilibrium can be observed by constancy of some observable properties like colour, pressure, concentration, density, temperature, refractive index etc.which may be suitable in a given reaction.
- At equilibrium, free energy change $\Delta G=0$
- Equilibrium state can be affected by altering factors like pressure, volume, concentration and temperature etc.(Le chateliers Principle).
- System moves toward an equilibrium state spontaneously even if it is disturbed. It will return to original state.

## Solved Examples

Ex-1. (1) Consider the following cases-
(I)

Equilibrium state has been attained
(II)

The nature of flow of energy in case (I) is same as that in-
(A) II
(B) III
(C) II and III
(D) None

Sol. (D) None, because in II and III, the flow of energy or matter is taking place only in one direction. While in equilibrium state, the flow of energy takes place in both directions equally. Thus (I) is a dynamic equilibrium while states in II and III are called steady state (static equilibrium).

Law of mass action : [By Guldberg and Waage]
Rate at which a substance reacts $\propto$ [Active Mass of the substance]
Active Mass = Molar concentration i.e. Moles/Litres

$$
=\frac{\text { Wt of substance }(\text { gram })}{\text { Molar wt. } \times \text { Vol. } . \text { Litre })}
$$

It is represented in square brackets i.e. [ ] e.g. [A], [ $\mathrm{N}_{2}$ ] etc.
Note: Active masses are dimensionless quantities but for our purposes we generally take them with dimensions of molarity, partical pressure, etc.
The rate of a chemical reaction at a particular temperature is proportional to the product of active masses of reactants raised to the powers of their stoichiometric coefficients.
Ex. $\mathrm{aA}+\mathrm{bB} \longrightarrow$ products
Rate of reaction $\alpha[A]^{a}[B]^{b}$
Rate $=k[A]^{a}[B]^{b}$, where $k$ is the rate constant of the reaction.

## Section (B \& C) : Homogeneous equilibrium: $K_{c}$ in gaseous system \& $K_{p}$ in gaseous system

## Equilibrium constant (K) :

For a general reaction

$$
\mathrm{aA}+\mathrm{bB} \rightleftharpoons c \mathrm{c}+\mathrm{dD}
$$

Forward reaction rate $r_{f}=k_{f}[A]^{a}[B]^{b}$,
Backward reaction rate $r_{b}=k_{b}[C]^{c}[D]^{d}$,
At equilibrium $\quad r_{f}=r_{b}$

$$
\mathrm{k}_{\mathrm{f}}[\mathrm{~A}]^{\mathrm{a}}{ }_{\mathrm{eq}}[B]^{\mathrm{b}}{ }_{\mathrm{eq}}=\mathrm{k}_{\mathrm{b}}[\mathrm{C}]^{\mathrm{c}} \mathrm{e}_{\mathrm{eq}}[\mathrm{D}]^{\mathrm{d}}{ }_{\mathrm{eq}}
$$

The concentrations of reactants \& products at equilibrium are related by

$$
\frac{\mathrm{k}_{\mathrm{f}}}{\mathrm{k}_{\mathrm{b}}}=\mathrm{K}_{\mathrm{c}}=\frac{[\mathrm{C}]_{\mathrm{eq}}^{\mathrm{c}}[\mathrm{D}]_{\mathrm{eq}}^{\mathrm{d}}}{[\mathrm{~A}]_{\mathrm{eq}}^{\mathrm{a}}[\mathrm{~B}]_{\mathrm{eq}}^{\mathrm{b}}}
$$

O $\quad \mathbf{K}_{\mathbf{c}}$ is a constant and is called the equilibrium constant in terms of concentration.
where all the concentrations are at equilibrium and are expressed in moles/litre.
e.g. $\quad \mathrm{PCl}_{5}(\mathrm{~g}) \rightleftharpoons \mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})$
$\Rightarrow \quad \mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{PCl}_{3}\right]_{\mathrm{eq}}\left[\mathrm{Cl}_{2}\right]_{\mathrm{eq}}}{\left[\mathrm{PCl}_{5}\right]_{\mathrm{eq}}}$
e.g. $\quad \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})$
$\Rightarrow \quad \mathrm{Kc}=\frac{\left[\mathrm{NH}_{3}\right]_{\mathrm{eq}}^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{H}_{2}\right]_{\mathrm{eq}}^{3}}$
e.g. $\frac{1}{2} \mathrm{H}_{2}(\mathrm{~g})+\frac{1}{2} \mathrm{I}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{HI}(\mathrm{g})$
$\Rightarrow \quad \mathrm{K}_{\mathrm{c}}=\frac{[\mathrm{HI}]_{\mathrm{eq}}}{\left[\mathrm{H}_{2}\right]_{\text {eq }}^{1 / 2}\left[\mathrm{I}_{2}\right]_{\text {eq }}^{1 / 2}}$

O $\quad K_{P} \rightarrow$ Equilibrium constant in terms of partial pressure. It is defined for the equilibrium reaction which contains at least one gaseous component.
e.g. $\quad a A(g)+b B(g) \rightarrow c C(g)+d D(g)$

$$
K_{P}=\frac{\left[P_{C}\right]_{\text {eq }}^{c}\left[P_{D}\right]_{\text {eq }}^{d}}{\left[P_{A}\right]_{\text {eq }}^{d}\left[P_{B}\right]_{\text {eq }}^{d}}
$$

Where various pressures are the partial pressures of various gases substances.

## Section (D) : Relation between Kp and Kc

O Relation between $K_{p}$ \& $K_{c}$

$$
\begin{aligned}
& P V=n R T \quad \text { or, } \quad P=\frac{n}{V} R T \\
P & =C R T \text { where } C=\frac{n}{V}=(\text { moles per litre }) \\
P_{C} & =[C] R T ; \quad P_{D}=[D] R T ; \quad P_{A}=[A] R T ; \quad P_{B}=[B] R T \\
\Rightarrow \quad K_{P} & =\frac{[C]^{c}(R T)^{c}[D]^{d}(R T)^{d}}{[A]^{a}(R T)^{a}[B]^{b}(R T)^{b}}=\frac{[C]^{c}[D]^{d}}{[A]^{a}[B]^{b}}(R T)^{(c+d)-(a+b)} \\
K_{p} & =K_{c}(R T)^{\Delta n}
\end{aligned}
$$

Where $\Delta \mathrm{n}_{\mathrm{g}}=(\mathrm{c}+\mathrm{d})-(\mathrm{a}+\mathrm{b})$, calculation of $\Delta \mathrm{n}$ involves only gaseous components.
$\Rightarrow \quad \Delta \mathrm{n}_{\mathrm{g}}=$ sum of the number of moles of gaseous products - sum of the number of moles of gaseous reactants. $\Delta \mathrm{n}_{\mathrm{g}}$ can be positive, negative, zero or even fraction.
$\mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{CaO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$
$\Delta \mathrm{n}_{\mathrm{g}}=1$ (because there is only one gas component in the products and no gas component in the reaction)
$\Rightarrow \mathrm{K}_{\mathrm{p}}=\mathrm{K}_{\mathrm{c}} .(\mathrm{RT})$

## Unit of Equilibrium contants :

- Unit of $K_{p}$ is $(a t m)^{\Delta n}$
- Unit of $K_{c}$ is $(\mathrm{mole} / \mathrm{Lit})^{\Delta n}=(\text { conc. })^{\Delta n}$

Note: $\bigcirc$ In fact, equilibrium constant does not carry any unit because it is based upon the activities of reactants and products and activities are unitless quantities. Under ordinary circumstances, where activities are not known, above types of equilibrium constant and their units are employed.
O For pure solids and pure liquids, although they have their own active masses but they remain constant during a chemical change (reaction). Therefore, these are taken to be unity for the sake of convenience.
e.g. $\quad \mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{CaO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$
$\mathrm{K}_{\mathrm{c}}=\left[\mathrm{CO}_{2}\right], \quad \mathrm{KP}=\mathrm{P}_{\mathrm{CO}_{2}}$

## Section (E) : Reaction quotient and Its applications

## - Predicting the direction of the reaction

## Reaction Quotient (Q)

At each point in a reaction, we can write a ratio of concentration terms having the same form as the equilibrium constant expression. This ratio is called the reaction quotient denoted by symbol Q .
It helps in predicting the direction of a reaction.
The expression $Q=\frac{[C]^{c}[D]^{d}}{[A]^{a}[B]^{b}}$ at any time during reaction is called reaction quotient. The concentrations
$[C],[D],[A],[B]$ are not necessarily at equilibrium.

- The reaction quotient is a variable quantity with time.
- It helps in predicting the direction of a reaction.
- if $Q>K_{c}$ reaction will proceed in backward direction until equilibrium in reached.

O if $Q<K_{c}$ reaction will proceed in forward direction until equilibrium is established.

- if $Q=K_{c}$ Reaction is at equilibrium.
eg. $\quad 2 \mathrm{~A}(\mathrm{~g})+\mathrm{B}(\mathrm{g}) \rightleftharpoons \mathrm{C}(\mathrm{g})+\mathrm{D}(\mathrm{g})$
$Q_{c}=$ Reaction quotient in terms of concentration
$Q_{c}=\frac{[C][D]}{[A]^{2}[B]}$
$\mathrm{K}_{\mathrm{C}}=\frac{[\mathrm{C}]_{\mathrm{eq}}[\mathrm{D}]_{\mathrm{eq}}}{[\mathrm{A}]_{\mathrm{eq}}^{2}[\mathrm{~B}]_{\mathrm{eq}}}$ [Here all the conc. are at equilibrium $]$

## Solved Examples

Ex-2. For the reaction $\operatorname{NOBr}(\mathrm{g}) \rightleftharpoons \mathrm{NO}(\mathrm{g})+\frac{1}{2} \mathrm{Br}_{2}(\mathrm{~g})$
$\mathrm{K}_{\mathrm{P}}=0.15 \mathrm{~atm}$ at $90^{\circ} \mathrm{C}$. If $\mathrm{NOBr}, \mathrm{NO}$ and $\mathrm{Br}_{2}$ are mixed at this temperature having partial pressures 0.5 atm, 0.4 atm and 0.2 atm respectively, will $\mathrm{Br}_{2}$ be consumed or formed?

Sol.

Predicting the extent of the reaction

$$
\mathrm{K}=\frac{[\text { Product }]_{\mathrm{eq}}}{[\text { Reac tan } t]_{\mathrm{eq}}}
$$

Case-I: If $K$ is large $\left(\mathrm{K}>10^{3}\right)$ then product concentration is very very larger than the reactant ([Product] $\gg$ [Reactant]) Hence concentration of reactant can be neglected with respect to the product. In this case, the reaction is product favourable and equilibrium will be more in forward direction than in backward direction.

Case-II : If K is very small $\left(\mathrm{K}<10^{-3}\right)$
[Product] << [Reactant]
Hence concentration of Product can be neglected as compared to the reactant.
In this case, the reaction is reactant favourable.

## Solved Examples

Ex-3. The $K_{P}$ values for three reactions are $10^{-5}, 20$ and 300 then what will be the correct order of the percentage composition of the products.

Sol. Since $K_{p}$ order is $10^{-5}<20<300$ so the percentage composition of products will be greatest for $K_{p}=300$.

## Section (F) : Properties of equilibrium Constant

- Equilibrium constant does not depend upon concentration of various reactants, presence of catalyst, direction from which equilibrium is reached
- The equilibrium constant does not give any idea about time taken to attain equilibrium.
- K depends on the stoichiometry of the reaction.
- If two chemical reactions at equilibrium having equilibrium constants $\mathrm{K}_{1}$ and $\mathrm{K}_{2}$ are added then the resulting equation has equilibrium constant $\mathrm{K}=\mathrm{K}_{1}$. $\mathrm{K}_{2}$

$$
\begin{array}{lll} 
& & \text { Equation constant } \\
& \mathrm{A}(\mathrm{~g}) \rightleftharpoons \mathrm{B}(\mathrm{~g}) & \mathrm{K}_{1} \\
\text { On adding } & \mathrm{B}(\mathrm{~g}) \rightleftharpoons \mathrm{C}(\mathrm{~g}) & \mathrm{K}_{2} \\
& \mathrm{~A}(\mathrm{~g}) \rightleftharpoons \mathrm{C}(\mathrm{~g}) & \mathrm{K}=\mathrm{K}_{1} \cdot \mathrm{~K}_{2}
\end{array}
$$

- If the reaction having eq. constant $\mathrm{K}_{1}$ is reversed then resulting equation has eq. constant $\frac{1}{\mathrm{~K}_{1}}$

$$
\begin{aligned}
& \mathrm{A}(\mathrm{~g})+\mathrm{B}(\mathrm{~g}) \rightleftharpoons \mathrm{C}(\mathrm{~g})+\mathrm{D}(\mathrm{~g}) \\
\text { On reversing, } & \mathrm{C}(\mathrm{~g})+\mathrm{D}(\mathrm{~g}) \rightleftharpoons \mathrm{A}(\mathrm{~g})+\mathrm{B}(\mathrm{~g}) \mathrm{K}=\frac{1}{\mathrm{~K}_{1}}
\end{aligned}
$$

- If a chemical reaction having equilibrium constant $\mathrm{K}_{1}$ is multiplied by a factor n then the resulting equation has equilibrium constant $K=\left(K_{1}\right)^{n}$, $n$ can be fraction
eg.

$$
\text { Multiplying by }\left(\frac{1}{2}\right), \quad \frac{1}{2} \mathrm{D}_{2} \rightleftharpoons \mathrm{~A} \quad \mathrm{~K}=\left(\mathrm{K}_{1}\right)^{1 / 2}=\sqrt{\mathrm{K}_{1}}
$$

- Equilibrium constant is dependent only on the temperature.

It means $K_{p}$ and $K_{c}$ will remain constant at constant temperature no matter how much changes are made in pressure, concentration, volume or catalyst.
O However if temperature is changed,
$\log \frac{k_{2}}{k_{1}}=\frac{\Delta H}{2.303 R}\left[\frac{1}{T_{1}}-\frac{1}{T_{2}}\right] ; \quad \Delta H=$ Enthalpy of reaction
If $T_{2}>T_{1}$ then $K_{2}>K_{1}$ provided $\Delta H=+$ ve (endothermic reaction)
$\mathrm{K}_{2}<\mathrm{K}_{1}$ if $\Delta \mathrm{H}=-\mathrm{ve}$ (exothermic reaction)
In the above equation, the unit of $R$ and $\Delta H / T$ should be same.

## Section (G) : Homogenuous Equilibrium (liquid system)

The reaction between alcohol and acid to form ester is an example of homogeneous equilibrium in liquid system.

$$
\begin{aligned}
& \mathrm{CH}_{3} \mathrm{COOH}(\ell)+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\ell) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}(\ell)+\mathrm{H}_{2} \mathrm{O}(\ell) \\
& \mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}\right]\left[\mathrm{H}_{2} \mathrm{O}\right]}{\left[\mathrm{CH}_{3} \mathrm{COOH}\right]\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right]}
\end{aligned}
$$

## Solved Examples

Ex-4. In an experiment starting with 1 mole of ethyl alcohol, 1 mole of acetic acid and 1 mole of water at T으, the equilibrium mixture on analysis shows that $54.3 \%$ of the acid is esterfied. Calculate the equilibrium constant of this reaction.
Sol.

Hence given $x=0.543$ mole
Applying law of mass action : $\mathrm{K}_{\mathrm{c}}=\frac{[\text { ester][water] }}{[\text { acid][alcohol] }}=\frac{0.543 \times 1.543}{0.457 \times 0.457}=4.0$

O EQUATION INVOLVING IONS :
Equilibrium involving ions always take place in aquous medium. In case of expression of Kc concentration of ion is taken.
Ex. $\quad \mathrm{Ag}^{+}$(aq. $)+\mathrm{Cl}^{-}$(aq. $) \rightleftharpoons \mathrm{AgCl}(\mathrm{s}) \mathrm{K}_{\mathrm{c}}=\frac{1}{\left[\mathrm{Ag}^{+}\right]\left[\mathrm{Cl}^{-}\right]}$

## Section (H) : Heterogenuous equilibrium

For pure solid and pure liquid, active mass is taken to be unity i.e. 1 as they remain constant throughout the reaction :

- $\mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{CaO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$
$\mathrm{K}_{\mathrm{P}}=\left(\mathrm{P}_{\mathrm{CO}_{2}}\right)_{\text {eq }}, \mathrm{K}_{\mathrm{c}}=\left[\mathrm{CO}_{2}(\mathrm{~g})\right]_{\text {eq }}$

$$
\left[\mathrm{CaCO}_{3}(\mathrm{~s})\right]=\frac{\text { moles }}{\text { volume }}=\frac{\mathrm{W}_{\mathrm{CaCO}_{3}}}{\frac{\mathrm{M}_{\mathrm{CaCO}_{3}}}{\mathrm{~V}}}=\frac{\text { density } \mathrm{CaCO}_{3}}{M_{\mathrm{CaCO}_{3}}}=\text { constant }
$$

$$
\mathrm{K}=\frac{[\mathrm{CaO}(\mathrm{~s})]_{\mathrm{eq}}\left[\mathrm{CO}_{2}(\mathrm{~g})\right]_{\mathrm{eq}}}{\left[\mathrm{CaCO}_{3}(\mathrm{~s})\right]_{\mathrm{eq}}}
$$

$$
\frac{\mathrm{K} \cdot\left[\mathrm{CaCO}_{3}(\mathrm{~s})\right]_{\mathrm{eq}}}{[\mathrm{CaO}(\mathrm{~s})]_{\mathrm{eq}}}=\left[\mathrm{CO}_{2}(\mathrm{~g})\right]_{\mathrm{eq}}
$$

$$
\mathrm{K} \mathrm{c}=\left[\mathrm{CO}_{2}(\mathrm{~g})\right]_{\mathrm{eq}}
$$

- $\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftharpoons \mathrm{H}_{2} \mathrm{O}(\mathrm{g})_{\text {eq }}$

$$
\mathrm{K}_{\mathrm{P}}=\left(\mathrm{P}_{\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})}\right)_{\mathrm{eq}}, \mathrm{~K}_{\mathrm{c}}=\left[\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})\right]_{\mathrm{eq}}
$$

[For pure solid and pure liquid active mass is taken as unity i.e. = 1]

## Section (I) : Degree of dissociation ( $\alpha$ ) and vapour density

It is the fraction of one mole dissociated into the products. (Defined for one mole of substance)
So, $\alpha=$ no. of moles dissociated / initial no. of moles taken

$$
=\text { fraction of moles dissociated out of } 1 \text { mole. }
$$

Note : \% dissociation $=\alpha \times 100$
Suppose 5 moles of $\mathrm{PCl}_{5}$ is taken and if 2 moles of $\mathrm{PCl}_{5}$ dissociated then $\alpha=\frac{2}{5}=0.4$
Let a gas $A_{n}$ dissociates to give $n$ moles of $A$ as follows-

$$
\begin{array}{llll} 
& \mathrm{A}_{\mathrm{n}}(\mathrm{~g}) \rightleftharpoons & \mathrm{nA}(\mathrm{~g}) \\
\mathrm{t}=0 & \mathrm{a} & 0 \\
\mathrm{t}=\mathrm{teq} & \mathrm{a}-\mathrm{x} & \mathrm{n} \cdot \mathrm{x} & \alpha=\frac{\mathrm{x}}{\mathrm{a}} \Rightarrow \quad \mathrm{x}=\mathrm{a} \alpha .
\end{array}
$$

$\mathrm{a}-\mathrm{a} \alpha=\mathrm{a}(1-\alpha) \quad \mathrm{n}$ a $\alpha$
Total no. of moles $=\mathrm{a}-\mathrm{a} \alpha+\mathrm{n} \mathrm{a} \alpha=[1+(\mathrm{n}-1) \alpha] \mathrm{a}$
Resonance ${ }^{\oplus}$ Educating for better tomorrow

## Significance of $\mathbf{n}$

$n=\frac{\text { sum of stoichiometric coefficient of product }}{\text { sum of coefficient of reactants }}$
(i) $\quad$ for $\mathrm{PCl}_{5}(\mathrm{~g}) \rightleftharpoons \mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \quad(\mathrm{n}=2)$
(ii) for $2 \mathrm{NH}_{3}(\mathrm{~g}) \rightleftharpoons \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \quad\left(\mathrm{n}=\frac{3}{2}+\frac{1}{2}=2\right)$
(iii) for $2 \mathrm{HI}(\mathrm{g}) \rightleftharpoons \mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \quad(\mathrm{n}=1)$

## Solved Examples

Ex-5. Calculate the degree of dissociation and $\mathrm{K}_{\mathrm{p}}$ for the following reaction.

|  | $\mathrm{PCl}_{5}(\mathrm{~g})$ | $\rightleftharpoons$ | $\mathrm{PCl}_{3}(\mathrm{~g})+$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{t}=0 \quad \mathrm{a}$ | 0 | $\mathrm{Cl}_{2}(\mathrm{~g})$ |  |
| $\mathrm{t}=\mathrm{t}$ | $\mathrm{a}-\mathrm{x}$ | x | x |
| Since for a mole, x moles are dissociated |  |  |  |

Sol. $\quad \therefore \quad$ For 1 mole, $\frac{x}{a}$ moles $=\alpha$ are dissociated
$\therefore \quad \mathrm{x}=\mathrm{a} \alpha$
$\begin{array}{lll}\quad \text { At } \quad \mathrm{t}=\mathrm{t}_{\text {eq }} & \mathrm{PCl}_{5}(\mathrm{~g}) \\ \mathrm{a}-\mathrm{a} \alpha\end{array} \rightleftharpoons \quad \begin{aligned} & \mathrm{PCl}_{3}(\mathrm{~g})+\quad \\ & \mathrm{a} \alpha\end{aligned} \quad \begin{aligned} & \mathrm{Cl} 2(\mathrm{~g}) \\ & \mathrm{a} \alpha\end{aligned}$
Total no. of moles at equilibrium $=\mathrm{a}+\mathrm{a} \alpha=\mathrm{a}(1+\alpha)$
$P_{\mathrm{PC}_{5}}=\frac{\mathrm{a}(1-\alpha) \mathrm{P}}{\mathrm{a}(1+\alpha)}, \mathrm{P}_{\mathrm{PC}_{3}}=\frac{\mathrm{a} \alpha \cdot \mathrm{P}}{\mathrm{a}(1+\alpha)}, \quad \mathrm{P}_{\mathrm{Cl}_{2}}=\frac{\mathrm{a} \alpha}{\mathrm{a}(1+\alpha)} \cdot \mathrm{P}$
$K_{P}=\frac{\left\{\left(\frac{\alpha P}{1+\alpha}\right)\right\}^{2}}{\left(\frac{1-\alpha}{1+\alpha}\right) P}$
$K_{P}=\frac{\alpha^{2} \cdot P}{1-\alpha^{2}}$ (Remember)

## Observed molecular weight and Observed Vapour Density of the mixture

Observed molecular weight of $\mathrm{A}_{\mathrm{n}}(\mathrm{g})=\frac{\text { molecular weight of } \mathrm{A}_{\mathrm{n}}(\mathrm{g})}{\text { total no. of moles at equilibrium }}=\frac{\mathrm{aM}_{\mathrm{th}}}{\mathrm{a}(1+(\mathrm{n}-1) \alpha)}$

$$
\therefore \quad M_{o b s} \quad=\frac{M_{\mathrm{th}}}{[1+(\mathrm{n}-1) \alpha]}
$$

where $\mathrm{M}_{\mathrm{th}}=$ theoritical molecular weight ( $\mathrm{n}=$ atomicity)
$M_{\text {mixture }}=\frac{M_{A_{n}}}{[1+(n-1) \alpha]}, M_{A_{n}}=$ Molar mass of gas $A_{n}$
Vapour density (V.D). : Density of the gas divided by density of hydrogen under same temp \& pressure is called vapour density.
O $\quad D=$ vapour density without dissociation $=\frac{M_{A_{n}}}{2}$

$$
\begin{aligned}
& d=\text { vapour density of mixture }=\text { observed v.d. }=\frac{M_{\text {mix }}}{2} \\
& \frac{D}{d}=1+(n-1) \alpha \\
\therefore \quad & \alpha=\frac{D-d}{(n-1) \times d}=\frac{M_{T}-M_{0}}{(n-1) M_{0}}
\end{aligned}
$$

Where $\mathrm{M}_{\mathrm{t}}=$ The oritical molecular wt., $\mathrm{M}_{0}=$ observed molecular wt. or molecular wt. of the mixture at equilibrium.
Note : It is not applicable for $\mathrm{n}=1 \mathrm{eg}$. Dissociation of $\mathrm{HI} \& \mathrm{NO}$ (as the total number of don't change during the dissociation.)

## Solved Examples

Ex-6. The vapour density of a mixture containing $\mathrm{NO}_{2}$ and $\mathrm{N}_{2} \mathrm{O}_{4}$ is 38.3 at $33^{\circ} \mathrm{C}$ calculate the no. of moles of $\mathrm{NO}_{2}$ if 100 g of $\mathrm{N}_{2} \mathrm{O}_{4}$ were taken initially.
Sol. $\quad \mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}_{2}(\mathrm{~g})$
$\mathrm{M}_{\text {mix }}=2 \times 38.3=76.6$
$M_{\text {mix }}=\frac{M_{\text {th }}}{1+\alpha}=\frac{92}{1+\alpha} \quad \Rightarrow \quad \alpha=0.2$

no. of moles of $\mathrm{NO}_{2}=2 \mathrm{a} \alpha=\frac{2 \times 100 \times 0.2}{92}=0.435$

## Section (J) : Thermodyanamics of equilibrium

For a general reaction, $\quad \mathrm{mA}+\mathrm{nB} \rightleftharpoons \mathrm{pC}+\mathrm{qD}, \quad \Delta \mathrm{G}$ is given by-
$\Delta G=\Delta G^{\circ}+2.303 R T \log _{10} Q$
where $\Delta G=$ Gibb's Free energy change
$\Delta \mathrm{G}^{\circ}=$ Standard Gibb's Free energy change
$\mathrm{Q}=$ reaction quotient
Since, at equlibrium, $\mathrm{Q}=\mathrm{K}$
Here K is thermodynamic equilibrium constant replacing $\mathrm{K}_{c}$ or $\mathrm{K}_{p}$

$$
\mathrm{K}=\frac{\left(\mathrm{a}_{\mathrm{C}}\right)^{\mathrm{p}}\left(\mathrm{a}_{\mathrm{D}}\right)^{\mathrm{q}}}{\left(\mathrm{a}_{\mathrm{A}}\right)^{m}\left(\mathrm{a}_{\mathrm{B}}\right)^{n}} ; \quad \text { Here ax denotes the activity of } \mathrm{X} .
$$

In fact, 'ax' is the ratio of the activity of substance at equilibrium and its activity in standard condition. That is why it is unitless and K is also unitless.
Note : (i) Themodynamic equilibrium constant is unitless since activity is unitless.
(ii) For pure solids \& pure liquids, activity is unity.
(iii) For gases (ideal behaviour), the activity is its partial pressure (in atm).
(iv) For components in solution, activity is molar concentration.

At equilibrium, $\Delta \mathrm{G}=0$
$\Rightarrow \quad \Delta G^{0}=-2.303 R T \log _{10} \mathrm{~K}$
Now since, $\quad \Delta \mathrm{G}^{\circ}=\Delta \mathrm{H}^{\circ}-\mathrm{T} \Delta \mathrm{S}^{\circ}$
where $\quad \Delta \mathrm{H}^{\circ}=$ Standard enthalpy change of the reaction
$\Delta \mathrm{S}^{\circ}=$ Standard entropy change
$\Rightarrow \quad-2.303 R T \log _{10} \mathrm{~K}=\Delta \mathrm{H}^{\circ}-\mathrm{T} \Delta \mathrm{S}^{\circ}$
$\Rightarrow \quad \log _{{ }_{10} \mathrm{~K}}=-\frac{\Delta \mathrm{H}^{\mathrm{o}}}{2.303} \cdot \frac{1}{\mathrm{RT}}+\frac{\Delta \mathrm{S}^{\circ}}{2.303 \mathrm{R}}$
If plot of $\operatorname{In} \mathrm{k}$ vs $\frac{1}{\mathrm{~T}}$ is plotted then it is a straight line with slope $=-\frac{\Delta \mathrm{H}^{\circ}}{\mathrm{R}}$ and intercept $=\frac{\Delta \mathrm{S}^{\circ}}{\mathrm{R}}$

Slope $=\frac{-\Delta H^{\circ}}{2.303 R}=\tan \theta$,

If at temperature $T_{1}$, equilibrium constant is $\mathrm{K}_{1}$ and at $\mathrm{T}_{2}$, it is $\mathrm{K}_{2}$ then ;

$$
\begin{align*}
& \log _{10} K_{1}=\frac{-\Delta H^{\circ}}{2.303 R} \cdot \frac{1}{T_{1}}+\frac{\Delta S^{o}}{2.303 R}  \tag{i}\\
& \log _{{ }_{10}} K_{2}=\frac{-\Delta H^{\circ}}{2.303 R} \cdot \frac{1}{T_{2}}+\frac{\Delta S^{o}}{2.303 R} \tag{ii}
\end{align*}
$$

## [Assuming $\Delta \mathbf{H}^{\circ}$ and $\Delta \mathbf{S}^{\circ}$ remains constant in this temperature range.]

Subtract eq. (ii) from (i) we get Vant Hoff equation-

$$
\log \left(\frac{K_{1}}{K_{2}}\right)=\frac{\Delta H^{\circ}}{2.303 R}\left(\frac{1}{T_{2}}-\frac{1}{T_{1}}\right)
$$

Note: $\mathrm{O} \Delta \mathrm{H}$ should be substituted with sign.
O Unit of $\Delta \mathrm{H} / \mathrm{T}$ and gas constant R should be same.
O For endothermic ( $\Delta \mathrm{H}>0$ ) reaction value of the equilibrium constant increases with the rise in temperature
O For exothermic $(\Delta \mathrm{H}<0)$ reaction, value of the equilibrium constant decreases with increase in temperature
Condition for spontaneity : $\Delta \mathrm{G}<0$ for spontaneous process or reaction.
Since, $\Delta G=\Delta H-T \Delta S$
$\Rightarrow \quad \Delta \mathrm{H}-\mathrm{T} \Delta \mathrm{S}<0 \quad \Rightarrow \quad \mathrm{~T}>\Delta \mathrm{H} / \Delta \mathrm{S}$

* $\Delta \mathrm{G}>0$ for non-spontaneous process or reaction.
* $\Delta \mathrm{G}=0$ for equilibrium.

## Solued Examples

Ex-7. Variation of equilibrium constant K with temperature T is given by van't Hoff equation,

$$
\log \mathrm{K}=\log \mathrm{A}-\frac{\Delta H^{\circ}}{2.303 \mathrm{RT}}
$$

A graph between $\log \mathrm{K}$ and $\mathrm{T}^{-1}$ was a straight line as shown in the figure and having $\theta=\tan ^{-1}(0.5)$ and $\mathrm{OP}=10$. Calculate :
(a) $\Delta \mathrm{H}^{\circ}$ (standard heat of reaction) when $\mathrm{T}=300 \mathrm{~K}$,
(b) A (pre-exponential factor),
(c) Equilibrium constant K , at 300 K ,
(d) K at 900 K if $\Delta \mathrm{H}^{\circ}$ is independent of temperature.

Sol. (a) $\log _{10} \mathrm{~K}=\log _{10} \mathrm{~A}-\frac{\Delta H^{\circ}}{2.303 R T}$
It is an equation of a straight line of the type $y=c+m x$
Slope ' $m$ ' $=\tan \theta=\frac{\Delta H^{\circ}}{2.303 \mathrm{R}}$
$0.5=\frac{\Delta H^{\circ}}{2.303 \times 8.314} \quad \Rightarrow \quad \Delta H^{\circ}=9.574 \mathrm{~J} \mathrm{~mol}^{-1}$
(b) Intercept 'c' $=\log _{10} \mathrm{~A}=10$
$\therefore \quad \mathrm{A}=10^{10}$
(c) $\quad \log \mathrm{K}=10-\frac{9.574}{2.303 \times 8.314 \times 298} \Rightarrow$
$K=9.96 \times 10^{9}$
(d) $\log \left(\frac{\mathrm{K}_{2}}{\mathrm{~K}_{1}}\right)=\frac{\Delta \mathrm{H}}{2.303 \mathrm{R}}\left\{\frac{1}{\mathrm{~T}_{1}}-\frac{1}{\mathrm{~T}_{2}}\right\}$
$\log \frac{\mathrm{K}_{2}}{9.96 \times 10^{9}}=\frac{9.574}{2.303 \times 8.314}\left\{\frac{1}{298}-\frac{1}{798}\right\}$
On solving $\quad K_{2}=9.98 \times 10^{9}$
Ans. (a) $9.574 \mathrm{~J} \mathrm{~mol}^{-1}$; (b) $\mathrm{A}=10^{10}$; (c) $9.96 \times 10^{9}$; (d) $9.98 \times 10^{9}$

## Section (K) : Le-chatelier's principle

## Le Chatelier's Principle:

If a change is applied to the system at equilibrium, then equilibrium will be shifted in that direction in which it can minimise the effect of change applied and the equilibrium is established again under new conditions.

- Effect of concentration : If the concentration of a component is increased, reaction shifts in a direction which tends to decrease its concentration. e.g. In the following example.

```
    \(\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})\)
[reactant] \(\uparrow\) Forward shift
[Product] \(\uparrow \quad\) Backward shift
```

O If concentration of reactant is increased at equilibrium then reaction shifts in the forward direction.
O If concentration of product is increased then reaction shifts in the backward direction
Note : The addition of any solid component does not affect the equilibrium.
Effect of volume :
O If volume is increased, pressure decreases hence reaction will shift in the direction in which pressure increases that is in the direction in which number of moles of gases increases and vice versa.
O If volume is increased then, for
$\Delta n_{g}>0$ reaction will shift in the forward direction
$\Delta \mathrm{n}_{\mathrm{g}}<0$ reaction will shift in the backward direction
$\Delta \mathrm{n}_{\mathrm{g}}=0$ reaction will not shift. eg. $\mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) 2 \mathrm{HI}(\mathrm{g}) \rightleftharpoons$ (No effect)

## Explanation :

(i) $\quad \Delta \mathrm{n}_{\mathrm{g}}>0$, eg. $\quad \mathrm{PCl}_{5}(\mathrm{~g}) \rightleftharpoons \mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})$

$$
Q_{c}=\frac{\frac{\left(\mathrm{n}_{\mathrm{Cl}_{2}}\right)}{\mathrm{V}} \times \frac{\left(\mathrm{n}_{\mathrm{PC}_{3}}\right)}{\mathrm{V}}}{\frac{\left(\mathrm{n}_{\mathrm{PC}_{5}}\right)}{\mathrm{V}}} \quad \Rightarrow \quad Q_{c} \propto \frac{1}{\mathrm{~V}} \text { for } \Delta \mathrm{n}_{\mathrm{g}}>0
$$

$$
[(n)=\text { moles }]
$$

On incerasing V , Qc, decreases. Now, for $Q_{c}<K_{c}$ reaction will shift in forward direction.
Thus, if, Volume $\uparrow$ Q $_{c} \downarrow$ (Forward shift)
Volume $\downarrow$ Qc $\uparrow$ (Backward shift)
(ii)

$$
\begin{array}{ll}
\Delta \mathrm{n}_{\mathrm{g}}<0, \text { eg. } \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons & 2 \mathrm{NH}_{3}(\mathrm{~g}) \\
\mathrm{Q}_{\mathrm{c}}=\left\{\frac{\left(\mathrm{n}_{\mathrm{NH}_{3}}\right)}{\mathrm{V}}\right\}^{2} /\left\{\frac{\left(\mathrm{n}_{\mathrm{N}_{2}}\right)}{\mathrm{V}}\right\} \\
& \Rightarrow\left\{\frac{\left(\mathrm{n}_{\mathrm{H}_{2}}\right)}{\mathrm{V}}\right\}^{3} \\
\mathrm{~V} \uparrow \mathrm{Qc}_{\mathrm{c}} \uparrow \text { (Backward shift) } & \Rightarrow \quad \mathrm{Q}_{\mathrm{c}} \propto \mathrm{~V}^{2} \quad \text { for } \Delta \mathrm{n}_{\mathrm{g}}<0
\end{array}
$$

## - Effect of pressure :

On increasing pressure, equilibrium will shift in the direction in which pressure decreases i.e. no. of moles in the reaction decreases and vice versa.
$\because \quad P \propto$ no. of moles
(i) For $\Delta \mathrm{n}_{\mathrm{g}}=0 \rightarrow$ No. effects
(ii) For $\Delta \mathrm{n}_{\mathrm{g}}>0, \quad \mathrm{PCl}_{5}(\mathrm{~g}) \rightleftharpoons \mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})$

$$
\mathrm{Q}_{\mathrm{p}}=\frac{\left(\mathrm{X}_{\mathrm{PCl}_{3}} \mathrm{P}\right) \cdot\left(\mathrm{X}_{\mathrm{Cl}_{2}} \mathrm{P}\right)}{\left(\mathrm{X}_{\mathrm{PC}_{5}} \cdot \mathrm{P}\right)} \quad \Rightarrow \quad \mathrm{Q}_{\mathrm{P}} \propto \mathrm{P} \quad[()=\text { mole fraction }]
$$

$P \downarrow ; Q_{p} \downarrow ;$ (Forward shift)
P 个; $\mathrm{Q}_{\mathrm{P}} \uparrow$; (Backward shift)

Educating for better tomorrow
(iii) For $\Delta \mathrm{n}<0$, eg.

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons \quad 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

$$
\begin{array}{lll}
\mathrm{Q}_{\mathrm{P}}=\frac{\left.\left[\left(\mathrm{X}_{\mathrm{NH}_{3}}\right) \mathrm{P}\right)\right]^{2}}{\left[\left(\mathrm{X}_{\mathrm{N}_{2}}\right) \cdot \mathrm{P}\right]\left[\left(\mathrm{X}_{\mathrm{H}_{2}}\right) \mathrm{P}\right]^{3}} & \Rightarrow & \mathrm{QP}_{\mathrm{P}} \propto \frac{1}{\mathrm{P}^{2}} \\
\mathrm{P} \uparrow ; \mathrm{QP}_{\mathrm{P}} \downarrow ; \text { (Forward shift) } & ; & \mathrm{P} \downarrow ; \mathrm{QP}_{\mathrm{P}} \uparrow ; \text { (Backward shift) }
\end{array}
$$

## - Effect of catalyst :

Due to catalyst, the state of equilibrium is not affected i.e. no shift will occur as catalyst lowers the activation energy of both the forward \& reverse reaction by same amount, thus altering the forward \& reverse rate equally and hence, the equilibrium will be attained faster i.e time taken to reach the equilibrium is less.

- Effect of inert gas addition :
(a) At constant volume : Inert gas addition has no effect at constant volume
(b) At constant pressure : If inert gas is added then to maintain the pressure constant, volume is increased. Hence equilibrium will shift in the direction in which larger no. of moles of gas is formed
(i) $\quad \Delta \mathrm{n}_{\mathrm{g}}>0$, reaction will shift in the forward direction
(ii) $\Delta \mathrm{n}_{\mathrm{g}}<0$, reaction will shift in the backward direction
(iii) $\Delta \mathrm{n}_{\mathrm{g}}=0$, no effect

## - Effect of temperature :

(i) Exothermic reaction : The reaction in which heat is evolved
eg.

$$
\mathrm{A}(\mathrm{~g})+\mathrm{B}(\mathrm{~g}) \rightleftharpoons \mathrm{C}(\mathrm{~g})+\mathrm{D}(\mathrm{~g})+\text { Heat } \quad \Delta \mathrm{H}=-\mathrm{ve}
$$

eg. $\quad \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})+$ Heat
$T \uparrow \quad \Rightarrow K^{\prime}$ will decrease
$\log \frac{K_{1}}{K_{2}}=\frac{\Delta H^{\circ}}{2.303 R}\left(\frac{1}{T_{2}}-\frac{1}{T_{1}}\right)$ (from vant' hoff equation)
$\log \frac{\mathrm{K}_{1}}{\mathrm{~K}_{2}}<0 \quad \Rightarrow \quad \log \mathrm{~K}_{1}-\log \mathrm{K}_{2}>0 \Rightarrow \quad \log \mathrm{~K}_{1}>\log \mathrm{K}_{2} \Rightarrow \quad \mathrm{~K}_{1}>\mathrm{K}_{2}$
Reaction will shift in backward direction.
$\mathrm{T} \downarrow \quad \Rightarrow \mathrm{K}$ will increases.
Reaction will shift in forward direction.
(ii) Endothermic reaction : energy consumed.

$$
\begin{array}{lll}
\mathrm{A}(\mathrm{~g})+\mathrm{B}(\mathrm{~g}) \rightleftharpoons \mathrm{C}(\mathrm{~g})+\mathrm{D}(\mathrm{~g})-\text { Heat } & \therefore \Delta \mathrm{H}=+\mathrm{ve} \\
\mathrm{~T} \uparrow \Rightarrow \mathrm{~K} \uparrow & \Rightarrow \quad \text { Forward } ; & \mathrm{T} \downarrow \Rightarrow \mathrm{~K} \downarrow
\end{array} \Rightarrow \quad \text { Backward } \text { l }
$$

## Application of le chatelier's principle : Practical equilibrium situations:

## Section (L) : Vapour pressure and Relative Humidity

It is the pressure exerted by the vapours over it's liquid when it is in equilibrium with the liquid. Vapour pressure of water is also called aqueous tension.

$$
\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftharpoons \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) ; \mathrm{K}=\mathrm{P}_{\mathrm{H}_{2} \mathrm{O}}=\text { constant at fixed temperature }
$$

Hence V.P. of liquid is independent of pressure, volume and concentration change.
e.g. at $25^{\circ} \mathrm{C}$, vapour pressure of water $\approx 24 \mathrm{~mm}$ of Hg

Relative Humidity $=\frac{\text { Partial pressure of } \mathrm{H}_{2} \mathrm{O} \text { vapours }}{\text { Vapour pressure of } \mathrm{H}_{2} \mathrm{O} \text { at that temp. }}$
Formation of diamond :

| $C($ graphite $)$ | $\rightleftharpoons$ |
| :---: | :---: |
| $\downarrow$ | $C$ (diamond) - Heat; |
| $\downarrow$ |  |
| Density Low | Density High |
| Volume High | Volume Low |

$$
\Delta \mathrm{H}=+\mathrm{ve}
$$

Density Low Density High
Volume Low
Formation of diamond is favourable at high pressure and high temperature

## Melting of ice :

| $\mathrm{H}_{2} \mathrm{O}(\mathrm{s})$ | $\rightleftharpoons$ | $\mathrm{H}_{2} \mathrm{O}(\ell) ;$ | $\downarrow$ |
| :--- | :--- | :--- | :--- |
| $\downarrow$ | $\downarrow \mathrm{H}=+\mathrm{ve}$ |  |  |
| Density Low |  | Density High |  |
| Volume High |  | Volume Low |  |

Melting of ice is favourable at high temperature and high pressure.

## - Boiling of water :

| $\mathrm{H}_{2} \mathrm{O}(\ell)$ | $\rightleftharpoons$ | $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ |
| :---: | :---: | :---: |
| $\downarrow$ |  | $\downarrow$ |
| Density High |  | Density Low |
| Volume Low |  | Volume High |

On incerasing pressure, equilibrium will shift in the direction in which volume is decreasing i.e. backward.
Hence, on incerasing pressure, the boiling point increases.

## - Formation of ammonia by Haber's process :

$\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g}) \Delta \mathrm{H}=-22.4 \mathrm{Kcal} / \mathrm{mol}$.
(i) The reaction will shift in the forward direction at low temperature, but at very low temperature the rate of reaction becomes very low; thus moderate temperature is used for this reaction.
(ii) At high pressure, reaction will shift in forward direction to form more product.

## - Manufacturing of $\mathrm{SO}_{3}$ by contact process

$$
2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{SO}_{3}(\mathrm{~g})+45.2 \mathrm{kcal}
$$

High pressure ( 1.5 to 1.7 atm ), Low temperature $\left(500^{\circ} \mathrm{C}\right)$, higher quantity of $\mathrm{SO}_{2}$ and $\mathrm{O}_{2}$ are favourable conditions for the formation of $\mathrm{SO}_{3}$.

## - Manufacturing of NO by Birkeland-Eyde process

$$
\mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}(\mathrm{~g})-43.2 \mathrm{kcal}
$$

O No effect on change of pressure
O High temperature $\left(1200^{\circ} \mathrm{C}\right.$ to $\left.2000^{\circ} \mathrm{C}\right)$, High concentration of $\mathrm{N}_{2}$ and $\mathrm{O}_{2}$ are favourable condition for the formation of NO .

## Solved Examples

Ex-8. The equilibrium constant of the reaction at $25^{\circ} \mathrm{C}$

$$
\mathrm{CuSO}_{4} .5 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) \rightleftharpoons \mathrm{CuSO}_{4} .3 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

is $1.084 \times 10^{-4} \mathrm{~atm}^{2}$. Find out under what conditions of relative humidity, $\mathrm{CuSO}_{4} .5 \mathrm{H}_{2} \mathrm{O}$ will start loosing its water of crystallization according to above reaction. (Vapour pressure of water at $25^{\circ} \mathrm{C}$ is 24 mm of Hg ).
Sol. $\quad \mathrm{K}_{\mathrm{P}}=\left(\mathrm{P}_{\mathrm{H}_{2} \mathrm{O}}\right)^{2} \quad$ so $\mathrm{P}_{\mathrm{H}_{2} \mathrm{O}}=\sqrt{1.084 \times 10^{-4}}=1.041 \times 10^{-2} \mathrm{~atm} \approx 8 \mathrm{~mm}$ of Hg
O If in a room, pressure of water is greater than 8 mm of Hg then $\mathrm{CuSO}_{4} .3 \mathrm{H}_{2} \mathrm{O}$ will absorb water from air and will form $\mathrm{CuSO}_{4} .5 \mathrm{H}_{2} \mathrm{O}$ \& will keep absorbing until partial pressure of $\mathrm{H}_{2} \mathrm{O}$ becomes 8 mm of Hg .
O If $\mathrm{P}_{\mathrm{H}_{2} \mathrm{O}}<8 \mathrm{~mm}$ of Hg then $\mathrm{CuSO}_{4.5} .5 \mathrm{H}_{2} \mathrm{O}$ will loose water of crystallization and reaction will move in forward direction.
i.e. If relative humidity $<\frac{8}{24}<33.33 \%$ then $\mathrm{CuSO}_{4} .5 \mathrm{H}_{2} \mathrm{O}$ will loose water of crystallization.

## Section (M) : Simultaneous equilibria

If in any container there are two or more equilibria existing simultaneously involving one or more than one common species. Then in both/all equilibrium the concentration of common species is the total concentration of that species due to all the equilibria under consideration.
e.g. $\quad A(s) \rightleftharpoons X(g)+Y(g)$
$\begin{array}{llll}t=0 & a & 0 & 0\end{array}$
$t=t_{\text {eq }} \quad a-t \quad t \quad t+u$
$\mathrm{B}(\mathrm{s}) \rightleftharpoons \mathrm{Z}(\mathrm{g})+\mathrm{Y}(\mathrm{g})$
$\begin{array}{lll}\mathrm{b} & 0 & 0\end{array}$
$b-u \quad u \quad u+t$
$K_{C_{1}}=t(u+t)$
$K_{C_{2}}=(u+t) u$

## Solved Examples

Ex-9. 102 g of solid $\mathrm{NH}_{4} \mathrm{HS}$ is taken in the 2 L evacuated flask at $57^{\circ} \mathrm{C}$. Following two equilibrium exist simultaneously

$$
\mathrm{NH}_{4} \mathrm{HS}(\mathrm{~s}) \rightleftharpoons \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g}) \quad ; \quad \mathrm{NH}_{3}(\mathrm{~g}) \rightleftharpoons \frac{1}{2} \mathrm{~N}_{2}(\mathrm{~g})+\frac{3}{2} \mathrm{H}_{2}(\mathrm{~g})
$$

one mole of the solid decomposes to maintain both the equilibrium and 0.75 mole of $\mathrm{H}_{2}$ was found at the equilibrium then find the equilibrium concentration of all the species and $\mathrm{K}_{\mathrm{c}}$ for both the reaction.
Sol. Moles of $\mathrm{NH}_{4} \mathrm{HS}=\frac{102}{51}=2$

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{C}_{1}}=\frac{1}{2} \frac{(1-\mathrm{x})}{2}=\frac{1}{8} \quad[\text { Since } \mathrm{V}=2 \mathrm{~L}] \\
& \mathrm{K}_{\mathrm{C}_{2}}=\frac{\left(\frac{3 \mathrm{x}}{4}\right)^{3 / 2}\left(\frac{\mathrm{x}}{4}\right)^{1 / 2}}{\left(\frac{1-\mathrm{x}}{2}\right)}=\frac{\left(\frac{3}{8}\right)^{3 / 2}\left(\frac{1}{8}\right)^{1 / 2}}{\frac{1}{4}}=(3)^{3 / 2} \frac{1}{64} \times \frac{4}{1}=\frac{(3)^{3 / 2}}{16}
\end{aligned}
$$

## SUMMARY

Chemical equilibrium is a dynamic state in which the concentration of reactants and products remain constant because the rates of the forward and the reverse reaction are equal. For the general reaction

$$
\mathrm{a} A(\mathrm{~g})+\mathrm{b} B(\mathrm{~g}) \rightleftharpoons c \mathrm{C}(\mathrm{~g})+\mathrm{d} \mathrm{D}(\mathrm{~g})
$$

concentrations in the equilibrium mixture are related by the equilibrium equation :

$$
\mathrm{K}_{\mathrm{c}}=\frac{[C]_{\mathrm{eq}}^{c}[\mathrm{D}]_{\mathrm{eq}}^{\mathrm{d}}}{[\mathrm{~A}]_{\mathrm{eq}}^{a}[B]_{\mathrm{eq}}^{b}}
$$

The ratio on the right side of the equation is called the equilibrium constant expression. The equilibrium constant $K_{c}$ is the number obtained when equilibrium concentrations (in $\mathrm{mol} / \mathrm{L}$ ) are substituted into the equilibrium constant expression. The value of $\mathrm{K}_{\mathrm{c}}$ varies with temperature and depends upon the form of the balanced chemical equation.
The equilibrium constant $K_{p}$ can be used for gas phase reactions. It is defined in the same way as $K_{c}$ except that the equilibrium constant expression contains partial pressures (in atmospheres) instead of molar concentrations. The constants $K_{p}$ and $K_{c}$ are related by the equation,

$$
\mathrm{K}_{\mathrm{p}}=\mathrm{K}_{\mathrm{c}}(\mathrm{RT})^{\Delta \mathrm{ng}}, \text { where } \Delta \mathrm{n}_{\mathrm{g}}=(\mathrm{c}+\mathrm{d})-(\mathrm{a}+\mathrm{b}) .
$$

Homogeneous equilibrium are those in which all reactants and products are in a single phase; heterogeneous equilibria are those in which reactants and products for heterogeneous equilibrium does not include concentrations of pure solids or pure liquids.
The value of the equilibrium constant for a reaction makes it possible to judge the extent of reaction, predict the direction of reaction, and calculate equilibrium concentrations (or partial pressures) from initial concentration (or partial pressures). The farther the reaction proceed towards completion, the larger the value of $\mathrm{K}_{\mathrm{c}}$. The direction of a reaction not at equilibrium depends on the relative values of $\mathrm{K}_{\mathrm{c}}$ and the reaction quotient $Q_{c}$ which is defined in the same way as $K_{c}$ except that the concentrations in the equilibrium constant expression are not necessarily equilibrium concentrations. If $Q_{c}<K_{c}$, net reaction goes from left to right to attain equilibrium; if $Q_{c}=K_{c}$, the system is at equilibrium.
The composition of an equilibrium mixture can be altered by changes in concentration, pressure (volume), or temperature. The qualitative effect of these changes is predicted by Le Chatelier's principle, which says that if a stress is applied to a reaction mixture at equilibrium, net reaction occurs in the direction that relieves the stress. Temperature changes affect equilibrium concentrations because $\mathrm{K}_{\mathrm{c}}$ is temperature-dependent. As the temperature increases, $\mathrm{K}_{\mathrm{c}}$ for an exothermic reaction decreases, and $K_{c}$ for an endothermic reaction increases.

A catalyst increases the rate at which chemical equilibrium is reached, but it does not affect the equilibrium constant or the equilibrium concentration. The equilibrium constant for a single-step reaction equals the ratio of the rate constants for the forward and reverse reactions: $K_{c}=k_{f} / k_{b}$.
Types of chemical reactions

## MISCELLANEOUS SOLVED PROBLEMS (MSPs)

1. An example of a reversible reaction is :
$(\mathrm{A}) \mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+2 \mathrm{NaI}(\mathrm{aq}) \rightleftharpoons \mathrm{Pbl}_{2}(\mathrm{~s})+2 \mathrm{NaNO}_{3}(\mathrm{aq})$
(B) $\mathrm{AgNO}_{3}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq}) \rightleftharpoons \mathrm{AgCl}(\mathrm{s})+\mathrm{HNO}_{3}(\mathrm{aq})$
(C) $2 \mathrm{Na}(\mathrm{s})+\mathrm{H}_{2} \mathrm{O}(\ell) \rightleftharpoons 2 \mathrm{NaOH}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
(D) $\mathrm{KNO}_{3}(\mathrm{aq})+\mathrm{NaCl}(\mathrm{aq}) \rightleftharpoons \mathrm{KCl}(\mathrm{aq})+\mathrm{NaNO}_{3}(\mathrm{aq})$

Ans. (D)
Sol. Precipitation reactions, acid base reactions and reactions in which gases are liberated and are taking place in open container will be irreversible reactions.
2. For the reaction, $A+B \rightleftharpoons 3 C$, if ' $a$ ' mol/litre of each ' $A$ ' \& ' $B$ ' are taken initially then at equilibrium the incorrect relation is :
(A) $[\mathrm{A}]-[\mathrm{B}]=0$
(B) $3[B]+[C]=3 a$
(C) $3[\mathrm{~A}]+[\mathrm{C}]=3 \mathrm{a}$
(D) $[\mathrm{A}]+[\mathrm{B}]=3[\mathrm{C}]$

Ans. (D)
Sol. At equilibrium :

$$
\begin{aligned}
& {[\mathrm{A}]=[\mathrm{B}]} \\
& {[\mathrm{A}]+\frac{1}{3}[\mathrm{C}]=\mathrm{a}}
\end{aligned}
$$

3. The equilibrium constant for the decomposition of water $\mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightarrow \mathrm{H}_{2}(\mathrm{~g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g})$ is given by : ( $\alpha=$ degree of dissociation of $\mathrm{H}_{2} \mathrm{O}(\mathrm{g}) ; \mathrm{p}=$ Total equilibrium pressure )
(A) $K=\frac{\alpha^{2} p^{1 / 2}}{(1+\alpha)(2-\alpha)^{1 / 2}}$
(B) $K=\frac{\alpha^{3 / 2} p^{1 / 2}}{(1-\alpha)(2+\alpha)^{1 / 2}}$
(C) $K=\frac{\alpha^{3} p^{1 / 2}}{\sqrt{2}}$
(D) $\mathrm{K}=\frac{\alpha^{3} \mathrm{p}^{3 / 2}}{(1-\alpha)(2+\alpha)^{1 / 2}}$

Ans. (B)
Sol : $\quad \mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightarrow \mathrm{H}_{2}(\mathrm{~g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g})$

| 1 | 0 | 0 |
| :--- | :--- | :--- |
| $1-\alpha$ | $\alpha$ | $\alpha / 2$ |

Total moles at equilibrium $=1-\alpha+\alpha+\alpha / 2=1+\alpha / 2$
Let the total pressure at equilibrium be $=p$
So, $\quad p_{H_{2} \mathrm{O}}=\frac{1-\alpha}{1+\alpha / 2} \times p$

$$
\mathrm{p}_{\mathrm{H}_{2}}=\frac{\alpha}{1+\alpha / 2} \times \mathrm{p}
$$

$$
\mathrm{p}_{\mathrm{O}_{2}}=\frac{\alpha / 2}{1+\alpha / 2} \times \mathrm{p}
$$

So $\quad K_{p}=\frac{\left(p_{\mathrm{O}_{2}}\right)^{1 / 2}\left(\mathrm{p}_{\mathrm{H}_{2}}\right)}{\left(\mathrm{p}_{\mathrm{H}_{2} \mathrm{O}}\right)}$
4. The reaction quotient $Q$ for $\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})$ is given by $\mathrm{Q}=\frac{\left[\mathrm{NH}_{3}\right]^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{H}_{2}\right]^{3}}$. The reaction will proceed in backward direction, when:
(A) $Q=K_{c}$
(B) $\mathrm{Q}<\mathrm{K}_{\mathrm{c}}$
(C) $\mathrm{Q}>\mathrm{K}_{\mathrm{c}}$
(D) $Q=0$

Ans. (C)
Sol. When $Q>K$, reaction will favour backward direction and when $Q<K$, it will favour forward direction.
5. 0.96 g of HI were heated to attain equilibrium $2 \mathrm{HI}(\mathrm{g}) \rightleftharpoons \mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g})$. The reaction mixture on titration requires 15.7 mL of $\mathrm{N} / 10$ hypo solution. Calculate degree of dissociation of HI.
Ans. 20.9\%

Educating for better tomorrow

Sol．meq of $\mathrm{I}_{2}=\frac{\mathrm{w}_{\mathrm{l}_{2}}}{127} \times 1000=1.57$

$$
\begin{aligned}
& \mathrm{w}_{1_{2}}=\frac{127 \times 1.57}{1000} \quad \mathrm{n}_{1_{2}}=\frac{1.57}{2000} \\
& 2 \mathrm{HI}(\mathrm{~g}) \stackrel{\mathrm{H}_{2}(\mathrm{~g})+\mathrm{l}_{2}(\mathrm{~g})}{\rightleftharpoons} \\
& \mathrm{a}-\mathrm{a} \mathrm{\alpha} \quad \frac{\mathrm{a} \alpha}{2} \quad \frac{\mathrm{a} \alpha}{2} \\
& \alpha=0.209 \quad \text { Ans. }
\end{aligned}
$$

6．Would $1 \% \mathrm{CO}_{2}$ by volume in air be sufficient to prevent any loss in weight when $\mathrm{M}_{2} \mathrm{CO}_{3}$ is heated at $120^{\circ} \mathrm{C}$ ？

$$
\mathrm{M}_{2} \mathrm{CO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{M}_{2} \mathrm{O}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g})
$$

$\mathrm{K}_{p}=0.0095 \mathrm{~atm}$ at $120^{\circ} \mathrm{C}$ ．How long would the partial pressure of $\mathrm{CO}_{2}$ have to be to promote this reaction at $120^{\circ} \mathrm{C}$ ？
Ans．（No reactions）
Sol．For，$\quad \mathrm{M}_{2} \mathrm{CO}_{3}(\mathrm{~g})(\mathrm{s}) \rightleftharpoons \mathrm{M}_{2} \mathrm{O}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$
$\because \mathrm{CO}_{2}$ is $1 \%$ in air ；$\quad \therefore \quad \mathrm{P}_{\mathrm{CO}_{2}}^{\prime}=\frac{1}{100} \times \mathrm{Pair}=\frac{1}{100} \times 1 \mathrm{~atm} .=0.01 \mathrm{~atm}$.
Also for equilibrium $\quad \mathrm{KP}_{\mathrm{P}}=\mathrm{P}_{\mathrm{CO}_{2}}^{\prime}=0.0095 \mathrm{~atm}$ ．
$\because \quad$ Given，$\quad \mathrm{P}_{\mathrm{CO}_{2}}^{\prime}=0.01 \mathrm{~atm}$ ．
Since decomposition is carried out in presence of $\mathrm{P}_{\mathrm{CO}_{2}}^{\prime}$ of 0.01 atm and $\mathrm{K}_{\mathrm{p}}=0.0095 \mathrm{~atm}$ ，thus， practically no decomposition of $\mathrm{M}_{2} \mathrm{CO}_{3}$ ．Thus， $1 \% \mathrm{CO}_{2}$ is sufficient to prevent any loss in weight．
If at all reaction is desired，the $\mathrm{P}_{\mathrm{CO}_{2}}^{\prime}$ must be lesser than 0.0095 atm as $\mathrm{P}_{\mathrm{CO}_{2}}^{\prime}$ at equilibrium cannot be more than 0.0095 atm．
Altrernate solution ：
For $\quad \mathrm{M}_{2} \mathrm{CO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{M}_{2} \mathrm{O}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$

$$
\left(\frac{1}{100}+P\right)
$$

$\because \quad \mathrm{K}_{\mathrm{P}}=\mathrm{P}_{\mathrm{CO}_{2}}^{\prime}$ and the pressure of $\mathrm{CO}_{2}$ already present in $1 / 100 \mathrm{~atm}$ ．Let the decomposition of $\mathrm{M}_{2} \mathrm{CO}_{3}$ produces the $\mathrm{CO}_{2}$ of pressure P ，then

$$
\therefore \quad K_{P}=\frac{1}{100}+P \quad \text { or } \quad 0.0095=P+001 \quad \text { or } \quad P=-0.0005 .
$$

The value of pressure comes negative and thus，it may be concluded that $\mathrm{M}_{2} \mathrm{CO}_{3}$ will not dissociate in pressure of $\mathrm{CO}_{2}$ of pressure 0.01 atm ．

7．For the chemical equilibrium， $\mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{CaO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$
$\Delta \mathrm{H}_{\mathrm{f}}$ ㅇan be determined from which one of the following plots ？
（A）

（B）

（C）

（D）

Reg．\＆Corp．Office：CG Tower，A－46 \＆52，IPIA，Near City Mall，Jhalawar Road，Kota（Raj．）－ 324005

Sol. $\quad \mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{CaO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$

$$
\begin{align*}
& \mathrm{K}_{\mathrm{p}}=\mathrm{P}_{\mathrm{CO}_{2}} \\
& \log \mathrm{~K}_{\mathrm{p}}=\log \mathrm{A}-\frac{\Delta \mathrm{H}_{r}^{0}}{2.303 \mathrm{RT}} \\
& \log \mathrm{P}_{\mathrm{co}_{2}}=\log \mathrm{A}-\frac{\Delta H_{0}^{0}}{2.303} \frac{1}{\mathrm{RT}} \tag{i}
\end{align*}
$$

Graph (a) represents (i) and its slope will be used to determine the heat of the reaction.
So, Ans. (A).
8. In a container of constant volume at a particular temparature $\mathrm{N}_{2}$ and $\mathrm{H}_{2}$ are mixed in the molar ratio of 9:13. The following two equilibria are found to be coexisting in the container

$$
\begin{aligned}
& \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g}) \\
& \mathrm{N}_{2}(\mathrm{~g})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{~g})
\end{aligned}
$$

The total equilibrium pressure is found to be 3.5 atm while partial pressure of $\mathrm{NH}_{3}(\mathrm{~g})$ and $\mathrm{H}_{2}(\mathrm{~g})$ are 0.5 atm and 1 atm respectively. Calculate of equilibrium constants of the two reactions given above.
Sol. Let the initial partial pressures of $\mathrm{N}_{2}$ and $\mathrm{H}_{2}$ be 9 P and 13 P respectively

$P_{\mathrm{NH}_{3}}=2 \mathrm{x}=0.5 \mathrm{~atm}$
$P_{H_{2}}=(13 P-3 x-2 y)=1 \mathrm{~atm}$
from (1)

$$
\begin{align*}
& \Rightarrow \quad(9 P-x-y)+1 \mathrm{~atm}+0.5+y=3.5  \tag{3}\\
& \Rightarrow \quad(9 P-x)=2 \mathrm{~atm}
\end{align*}
$$

so $\quad 9 \mathrm{P}=2.25$
$\mathrm{P}=0.25 \mathrm{~atm}$
from (3) equation $\quad 2 y=1.5$
$y=0.75 \mathrm{~atm}$
so $\quad P_{\mathrm{N}_{2}}=9 P-x-y=1.25 \mathrm{~atm}$
$\mathrm{P}_{\mathrm{H}_{2}}=1 \mathrm{~atm}$
$P_{\mathrm{NH}_{3}}=0.5 \mathrm{~atm}$
$\mathrm{P}_{\mathrm{N}_{2} \mathrm{H}_{4}}=0.75 \mathrm{~atm}$
So, $\quad K_{P_{1}}=\frac{P_{N H_{3}}^{2}}{P_{H_{2}}^{3} \cdot P_{N_{2}}}=\frac{0.5 \times 0.5}{1 \times 1 \times 1 \times 1.25}=0.2 \mathrm{~atm}^{-2}$
$K_{P_{2}}=\frac{P_{N_{2} H_{4}}}{P_{N_{2}} \cdot P_{H_{2}}^{2}}=\frac{0.75}{1 \times 1 \times 1.25}=0.6 \mathrm{~atm}^{-2}$
