On multiply equation (i) and (ii) we get

$\mathrm{K}_{\mathrm{c}}=\frac{(3 / 10)^{3}}{(3 / 10)^{3}}=1$
4. $\mathrm{K}=\mathrm{Ae}^{-\Delta H / R T}$
$\log K=\log A-\frac{\Delta H}{2.303 R T}$.
$\log K=\log A-\frac{\Delta H}{2.303 R} \times \frac{1}{T}$.
$\log K=\left[-\frac{\Delta H}{2.303 R}\right] \times \frac{1}{T}+\log A$.
$\frac{-\Delta H}{2.303 R}=1$.
$\Delta H=-2.303 R=-4.606$ cal.
5. $\quad a A+b B \rightleftharpoons c C+d D$

At high temp. \& low pressure equilibrium is shifting in backward direction. It means $(a+b)>(c+d) \&$ heat will reaction in the formation of producers is $\Delta \mathrm{H}<0$.
6.

then at equilibrium, $\quad \frac{\mathrm{n}_{\mathrm{BrCl}}}{\mathrm{n}_{\mathrm{Cl}_{2}}}=\frac{0.1}{0.01}=10=\frac{2 \mathrm{x}}{1-\mathrm{x}}$
So, $\quad 10-10 x=2 x$ or $\quad x=\frac{10}{12}=\frac{5}{6}$ moles
Moles of $\mathrm{Br}_{2}(\ell)$ required for maintaining vapour pressure of 0.1 atm

$$
=2 \times \frac{5}{6} \text { moles }=\frac{10}{6} \text { moles }=\text { moles of } \operatorname{BrCl}(\mathrm{g}) .
$$

Moles required for taking part in reaction $=$ moles of $\mathrm{Cl}_{2}$ used up $=\frac{5}{6}$ moles.
Hence total moles required $=\frac{5}{6}+\frac{10}{6}=\frac{15}{6}$ moles.
7. As in the gaseous mixture only $A$ will be present so the molecular weight of the gaseous mixture will be ' $\mathrm{MA}^{\prime}$ '
$\because \quad P M_{A}=d R T \quad$ where $R, P, T$ are const
so $\quad d \propto M A$
and hence it does not depend on ' $\alpha$ '
so 'd' will remain constant.
Option (D) is correct.
12. $\mathrm{CH}_{3} \mathrm{COOH}_{(\ell)}+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}_{(\ell)} \rightleftharpoons \mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5(\ell)}+\mathrm{H}_{2} \mathrm{O}_{(\ell)}$

$$
\begin{array}{llll}
1-0.5 & 1-0.5 & 0.5 & 0.5
\end{array}
$$

So, $\quad \mathrm{K}_{\mathrm{c}}=\frac{0.5 \times 0.5}{0.5 \times 0.5}=1$
Now let a moles of $\mathrm{CH}_{3} \mathrm{COOH}$ and $b$ moles of $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ are taken :
$a-\frac{a}{3}$
b- $\frac{a}{3}$
$\frac{a}{3} \quad \frac{a}{3}$

So, $K_{c}=\frac{(a / 3) \times(a / 3)}{2 a / 3 \times\left(b-\frac{a}{3}\right)} \quad$ or $\quad 2\left(b-\frac{a}{3}\right)=\frac{a}{3} \quad$ or $\quad 2 b=a \quad$ or $\quad \frac{a}{b}=\frac{2}{1}$
13. $\quad \mathrm{NH}_{2} \mathrm{COONH}_{4}(\mathrm{~s}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g})$.

& \mathrm{~K}_{\mathrm{p}}=\mathrm{P}_{\mathrm{NH}_{3}}^{2} \times \mathrm{P}_{\mathrm{CO}_{2}}=32 \mathrm{~atm}^{3} .
\end{aligned}
$$

Therefore $x=32 \& y=6 \Rightarrow x+y=38$.
