$=4 \mathrm{~m} / \mathrm{s}^{2}$
Spring Force $=10 \times 12=120 \mathrm{~N}$
6. There is no horizontal force on block A, therefore it does not move in x -directing, whereas there is net downward force $(\mathrm{mg}-\mathrm{N})$ is acting on it, making its acceleration along negative $y$-direction.
Block B moves downward as well as in negative x-direction. Downward
 acceleration of $A$ and $B$ will be equal due to constrain, thus w.r.t. $B$, A moves in positive x-direction.
Due to the component of normal exerted by $C$ on $B$, it moves in negative $x$-direction.
7. Pseudo force depends on acceleraton of frame and mass of object

## PART－IV

1．FBD of Block in ground frame ：
Applying N．L．$\quad 150+450-10 \mathrm{M}=5 \mathrm{M}$
$\Rightarrow \quad 15 \mathrm{M}=600 \quad \Rightarrow \quad M=\frac{600}{15}$

$\Rightarrow \quad M=40 \mathrm{Kg}$ Ans．
Normal on block is the reading of weighing machine i．e． 150 N ．
2．If lift is stopped \＆equilibrium is reached then

So block will lose the contact with weighing machine thus reading of weighing machine will be zero．

So reading of spring balance will be 40 Kg ．
3.

Ans．

4．$a_{p}=\frac{10 t}{10}=t$
$\therefore \quad \frac{\mathrm{dv}}{\mathrm{dt}}=\mathrm{t} \Rightarrow \quad \int_{0}^{\mathrm{v}} \mathrm{dv}=\int_{0}^{\mathrm{t}} \mathrm{t} d \mathrm{dt} \Rightarrow \quad \mathrm{v}=\frac{\mathrm{t}^{2}}{2}$
Putting $v=2$ we have $t=2$ sec．
Now $\quad \frac{\mathrm{dx}}{\mathrm{dt}}=\frac{\mathrm{t}^{2}}{2} \quad \therefore \quad \mathrm{x}_{\mathrm{p}}=\left[\frac{\mathrm{t}^{3}}{6}\right]_{0}^{2}=\frac{4}{3}$
$x_{B}=2 \times 2=4 \mathrm{~m}$
Hence relative displacement $=4-4 / 3=8 / 3 \mathrm{~m}$

Let $v_{x}$ and $v_{y}$ be the horizontal and vertical component of velocity of block $C$.
The component of relative velocity of $B$ and $C$ normal to the surface of contact is zero.
$\therefore \quad 10+5 \cos 37^{\circ}-v_{x}=0$
$\mathrm{v}_{\mathrm{x}}=14 \mathrm{~m} / \mathrm{s}$
From the figure $\ell_{1}+\ell_{2}+\ell_{3}=$ constant
