## EXERCISE \# 1

## PART - I

A-1. (i) 2 g of $\mathrm{H}_{2}=1 \mathrm{~mole}_{\mathrm{H}}^{2}$ $1 \mathrm{~mole}=22.4 \mathrm{~L}$
(ii) 16 g of $\mathrm{O}_{3}=\frac{1}{3}$ mole of $\mathrm{O}_{3}$

A-2. Number of moles of $\mathrm{N}_{2} \mathrm{O}$ in 100 g mixture $=\frac{66}{44}=1.5$
Number of moles of $\mathrm{H}_{2}$ in 100 g mixture $=\frac{34}{2}=17$

$$
M_{\text {average }}=\frac{100}{18.5}=5.40
$$

B-2. $\quad 1 \mathrm{~g}$ atom of $\mathrm{Fe}(56 \mathrm{~g} \mathrm{Fe})$ is present in 1 mole of the compound. As 4.6 g Fe are present in 100 g of the compound, 56 g of Fe will be present in $\frac{100}{4.6} \times 56 \mathrm{~g}=1217 \mathrm{~g}$ of the compound.

B-3.

| H | $\mathbf{1}$ | $\mathbf{2 5}$ | 25 | $\frac{25}{6.25}=4$ | $\mathbf{4}$ |
| C | $\mathbf{1 2}$ | $\mathbf{7 5}$ | $\frac{75}{12}=6.25$ | $\frac{6.25}{6.25}=1$ | $\mathbf{1}$ |

So empirical formula $\mathrm{CH}_{4}$.
C -1. $\quad \mathrm{Ag}_{2} \mathrm{CO}_{3} \xrightarrow{\Delta} 2 \mathrm{Ag}+\mathrm{CO}_{2}$
$276 \mathrm{~g} \mathrm{Ag}_{2} \mathrm{CO}_{3}=216 \mathrm{~g}$ of Ag
$\therefore 2.76 \mathrm{~g}$ of $\mathrm{Ag}_{2} \mathrm{CO}_{3}=2.16 \mathrm{~g}$ of Ag .
C-2. $\quad 3 \mathrm{Fe}+4 \mathrm{H}_{2} \mathrm{O} \xrightarrow{\Delta} \mathrm{Fe}_{3} \mathrm{O}_{4}+4 \mathrm{H}_{2}$
$\frac{\text { Mole of } \mathrm{Fe}}{\text { Mole of } \mathrm{H}_{2} \mathrm{O}}=\frac{3}{4}$
Mole of $\mathrm{Fe}=\frac{18}{18} \times \frac{3}{4}=\frac{3}{4}$
Weight of $\mathrm{Fe}=\frac{3}{4} \times 56=42 \mathrm{~g}$.
C-3. (i) Mole of oxygen $=\frac{448}{22400}=0.02$
Wt . of oxygen $=0.02 \times 32=0.64 \mathrm{~g}$.
$2 \mathrm{KClO}_{3} \xrightarrow{\Delta} 2 \mathrm{KCl}+3 \mathrm{O}_{2}$
0.02 mol
$2 \mathrm{~mol}_{\mathrm{KClO}}^{3}$ $\equiv 2 \mathrm{~mol} \mathrm{KCl} \equiv 3 \mathrm{~mol} \mathrm{O}_{2}$
(ii) Mass of $\mathrm{KClO}_{3}$ originally taken $=\frac{2}{3} \times 0.2 \times 122.5=1.64 \mathrm{~g}$
(iii) Mass of KCl produced $=\frac{2}{3} \times 0.02 \times 74.5=0.993 \mathrm{~g}$

D-1.

$$
3 \mathrm{CaCO}_{3}+2 \mathrm{H}_{3} \mathrm{PO}_{4} \longrightarrow \mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}+3 \mathrm{H}_{2} \mathrm{O}+3 \mathrm{CO}_{2}
$$

$$
\frac{50}{100} \quad \frac{73.5}{98}=\frac{3}{4} \quad 0 \quad 0
$$

final mole $\quad 0 \quad \frac{3}{4}-\frac{1}{2} \times \frac{2}{3}=\frac{5}{12} \quad \frac{1}{6}$

D-2. (a) $\mathrm{Br}_{2}+\mathrm{Cl}_{2} \longrightarrow 2 \mathrm{BrCl}$

$$
1 \mathrm{~mol} 1 \mathrm{~mol} 2 \mathrm{~mol}
$$

$$
0.025 \quad 0.025 \quad 0.050 \mathrm{~mol}
$$

$$
\text { Theoretical yield of } \mathrm{BrCl}=0.050 \mathrm{~mol}
$$

$$
\text { actual yield is }=\frac{0.05 \times 80}{100}=0.04 \text { mole }
$$

(b) $\quad \mathrm{Br}_{2}$ left unreacted $=0.025-0.02=0.005 \mathrm{~mol}$.

E-1.

$$
2 \mathrm{~mol} \mathrm{KClO}_{3} \equiv 3 \mathrm{~mol} \mathrm{O}_{2}
$$

Also $4 \mathrm{~mol} \mathrm{KClO}_{3} \equiv 3 \mathrm{~mol} \mathrm{KClO}_{4}$
or $\quad \frac{4}{3} \mathrm{~mol} \mathrm{KClO}_{3} \equiv 1 \mathrm{~mol} \mathrm{KClO}_{4}$
$\therefore \quad \mathrm{KClO}_{3}, 2+\frac{4}{3}=\frac{10}{3}$ moles.
E-2. Moles of Ca in $\mathrm{Ca}=$ moles of Ca in CaO
or $1 \times$ moles of $\mathrm{Ca}=1 \times$ moles of CaO
$\frac{1}{40}=\frac{m}{56} \quad$ or $\quad m=1.4 \mathrm{~g}$
E-3. On heating $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and $\mathrm{NaHCO}_{3}, \mathrm{Na}_{2} \mathrm{CO}_{3}$ remains unchanged while $\mathrm{NaHCO}_{3}$ changes into $\mathrm{Na}_{2} \mathrm{CO}_{3}$, $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$. The loss in weight is due to removal of $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$ which escape out on heating.
$\therefore$ wt. of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ in the product $=2.00-0.248=1.752 \mathrm{~g}$.
Let the weight of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ in the mixture be $X \mathrm{~g}$.
$\therefore$ wt. of $\mathrm{NaHCO}_{3}=(2.00-X) \mathrm{g}$.
Since $\mathrm{Na}_{2} \mathrm{CO}_{3}$ in the products contains $X \mathrm{~g}$ of unchanged reactant $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and rest produced from $\mathrm{NaHCO}_{3}$.
The wt. of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ produced by $\mathrm{NaHCO}_{3}$ only $=(1.752-X) \mathrm{g}$.
Now, we have ,

Applying POAC for Na atoms ,
moles of Na in $\mathrm{NaHCO}_{3}=$ moles of Na in $\mathrm{Na}_{2} \mathrm{CO}_{3}$
$1 \times$ moles of $\mathrm{NaHCO}_{3}=2 \times$ moles of $\mathrm{Na}_{2} \mathrm{CO}_{3}$

$$
\begin{aligned}
& \frac{2.0-X}{84}=2 \times \frac{1.752-X}{106} \\
& X=\frac{82}{62}=1.328 \mathrm{~g} . \\
\therefore \quad & \% \text { of } \mathrm{Na}_{2} \mathrm{CO}_{3}=\frac{1.328}{2.0} \times 100=66.4 \% .
\end{aligned}
$$

E-4. Let x g chalk $\left(\mathrm{CaCO}_{3}\right),(5-\mathrm{x}) \mathrm{g}$ clay present

$$

$\mathrm{d}_{\text {sol }}=1.2 \mathrm{~g} \mathrm{~mL}^{-1}$
$\mathrm{m}=\frac{\mathrm{W}_{2} \times 1000}{\mathrm{Mw}_{2} \times \mathrm{W}_{1}}$
In the above relation, $W_{1}$ is unknown, so find $W_{1}$.
$\mathrm{W}_{1}=\left(\mathrm{W}_{\text {sol }}-\mathrm{W}_{2}\right) \mathrm{g}=\left(\mathrm{V}_{\text {sol }} \times \mathrm{d}_{\text {sol }}-\mathrm{W}_{2}\right) \mathrm{g}=(500 \times 1.5-7.45) \mathrm{g}$
$\therefore \quad \mathrm{m}=\frac{7.45 \times 1000}{74.5 \times 592}=0.168 \mathrm{~mol} \mathrm{~kg}^{-1}=0.168 \mathrm{~m}$.

$\therefore$ mole of solute $=5$
mass of solute $=5 \times 40=200 \mathrm{~g}$

Initial weight of $\mathrm{P}=$ Final weight of P .
$31=[a \times 4] \times 31+[b \times 4] \times 31$
$4 a+4 b=1] \quad(1) \times 3$
Initial weight of oxygen $=$ Final weight of oxygen
$32=[a \times 6] \times 16+[a \times 10] \times 16$
$3 a+5 b=1]$
(2) $\times 4$
$12 a+20 b=4$
$12 a+12 b=3$
So $\quad b=\frac{1}{8}$
$8 \mathrm{~b}=1$

In 24 hr . moles of sucrose consumed $=\frac{34}{342} \times 24$.
$\therefore \quad \ln 24 \mathrm{hr}$. moles of $\mathrm{O}_{2}$ required $=\frac{34}{342} \times 24 \times 12$. (according to stoichiometry).
mass of $\mathrm{O}_{2}$ required $=\frac{34}{342} \times 24 \times 12 \times 32=916.2 \mathrm{~g}$.
4. (A) Explanation : $2 \mathrm{Ag}+\mathrm{S} \rightarrow \mathrm{Ag}_{2} \mathrm{~S}$
$2 \times 108 \mathrm{~g}$ of Ag reacts with 32 g of sulphur
10 g of Ag reacts with $\frac{32}{216} \times 10=\frac{320}{216}>1 \mathrm{~g}$
It means ' $S$ ' is limiting reagent
32 g of S reacts to form $216+32=248 \mathrm{~g}$ of $\mathrm{Ag}_{2} \mathrm{~S}$
1 g of S reacts to form $=\frac{248}{32}=7.75 \mathrm{~g}$
Alternately
$n_{\text {eq }}$ of $\mathrm{Ag}=\frac{10}{108}=0.0925 \quad n_{\text {eq }}$ of $S=\frac{1}{16}=0.0625 \quad$ ( $n$ eq $=$ number of equivalents)
Since $n_{\text {eq }}$ of $S$ is less than $n_{\text {eq }}$ of $A g$
$\Rightarrow 0.0625$ eq of Ag will react with 0.0625 eq of $S$ to form 0.0625 eq of $\mathrm{Ag}_{2} S$
Hence , amount of $\mathrm{Ag}_{2} \mathrm{~S}=\mathrm{n}_{\text {eq }} \times$ Eq. wt. of $\mathrm{Ag}_{2} \mathrm{~S}=0.0626 \times 124=7.75 \mathrm{~g}$

$$
\frac{64 \times 10^{3}}{64}=\text { mole of } \mathrm{C}_{2} \mathrm{H}_{4}

```
From equation (2)
    \(\frac{\text { mole of } \mathrm{C}_{2} \mathrm{H}_{4}}{\mathrm{n}}=\frac{\text { mole of polymer }}{1}\)
    \(\frac{10^{3}}{\mathrm{n}}=\frac{\mathrm{wt} \text {. of polymer }}{\mathrm{n}(28)}\)

$\mathrm{CrO}_{2} \mathrm{Cl}_{2} ; \mathrm{x}+2(-2)+2(-1)=0$
or $\quad x=+7$;
or $\quad x=+6$.
2. (i) $4.0 \mathrm{M}, 500 \mathrm{ml} \mathrm{NaCl}$
no. of m moles of $\mathrm{NaCl}=500 \times 4=2000 \mathrm{~m}$ moles $=2$ moles $=2$ moles $\mathrm{Cl}^{-}$ions
as $\quad 2 \mathrm{Cl}^{-} \longrightarrow \mathrm{Cl}_{2}+2 \mathrm{e}^{-}$
so $\quad 1 \mathrm{~mole}$ of $\mathrm{Cl}_{2}$ is generated.
(ii) no. of moles of $\mathrm{Na}^{+}=2$ moles
so max. wt of Na amalgam (assuming equimolar $\mathrm{Na} \& \mathrm{Hg}$ )

$$
=46+400=446 \mathrm{~g} .
$$

(iii) Two moles of $\mathrm{e}^{-}$are required $=2 \times 96500 \mathrm{C}=193000 \mathrm{C}$.
3. Average titre value $=\frac{25.2+25.25+25.0}{3}=\frac{75.45}{3}=25.15=25.2 \mathrm{~mL}$ number of significant figures will be 3 .
4.

So, the difference in oxidation state of sulphur is $5-0=5$
5. The balance chemical equation is
$3 \mathrm{Br}_{2}+3 \mathrm{Na}_{2} \mathrm{CO}_{3} \longrightarrow 5 \mathrm{NaBr}+\mathrm{NaBrO}_{3}+3 \mathrm{CO}_{2}$
6. Mole $=\frac{120}{60}=2$
mass of solution $=1120 \mathrm{~g}$
$V=\frac{1120}{1.15 \times 1000}=\frac{112}{115} L$
$\mathrm{M}=\frac{2 \times 115}{112}=2.05 \mathrm{~mol} / \mathrm{litre}$
7. $29.2 \%(\mathrm{w} / \mathrm{w}) \mathrm{HCl}$ has density $=1.25 \mathrm{~g} / \mathrm{ml}$

Now, mole of HCl required in $0.4 \mathrm{M} \mathrm{HCl}=0.4 \times 0.2$ mole $=0.08$ mole
if v mol of orginal HCl solution is taken
then volume of solution $=1.25 \mathrm{v}$
mass of $\mathrm{HCl}=(1.25 \mathrm{v} \times 0.292)$
mole of $\mathrm{HCl}=\frac{1.25 \mathrm{v} \times 0.292}{36.5}=0.08$
so, $v=\frac{36.5 \times 0.08}{0.29 \times 1.25} \mathrm{~mol}=8 \mathrm{~mL}$
8. $\quad 6 \mathrm{I}^{-}+\mathrm{ClO}_{3}^{-}+6 \mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{Cl}^{-}+6 \mathrm{HSO}_{4}^{-}+3 \mathrm{I}_{2}+3 \mathrm{H}_{2} \mathrm{O}$

Hence, $\mathrm{I}^{-}$is oxidised to $\mathrm{I}_{2}$
Coefficient of $\mathrm{HSO}_{4}^{-}=6$
and $\mathrm{H}_{2} \mathrm{O}$ is one of the product.
Hence (A), (B), (D)
9. Given 3.2 M solution
$\therefore$ moles of solute $=3.2 \mathrm{~mol}$
Consider 1 L Solution.
$\therefore$ volume of solvent $=1 \mathrm{~L}$
$P_{\text {solvent }}=0.4 \mathrm{~g} . \mathrm{mL}^{-1} \quad \therefore \mathrm{~m}_{\text {solvent }}=\mathrm{P} \times \mathrm{V}=400 \mathrm{~g}$
$\therefore$ molality $=\frac{3.2 \mathrm{~mol}}{0.4 \mathrm{~kg}}=8 \mathrm{molal}$
10. Molality $(\mathrm{m})=\frac{\mathrm{X}_{\text {solute }} \times 1000}{\mathrm{X}_{\text {solvent }} \times \mathrm{M}_{\text {solvent }}}=\frac{0.1 \times 1000}{0.9 \times \mathrm{M}_{\text {solvent }}}$

Molarity $(M)=\frac{0.1 \times 2 \times 1000}{0.1 \mathrm{M}_{\text {solute }}+0.9 \mathrm{M}_{\text {solvent }}}$
As Molality = Molarity
So $\quad \frac{0.1 \times 1000}{0.9 \times \mathrm{M}_{\text {solvent }}}=\frac{0.1 \times 2 \times 1000}{0.1 \mathrm{M}_{\text {solute }}+0.9 \mathrm{M}_{\text {solvent }}}$
So $\quad 0.1 \mathrm{M}_{\text {solute }}+0.9 \mathrm{M}_{\text {solvent }}=1.8 \mathrm{M}_{\text {solvent }}$
So $\quad \frac{M_{\text {solute }}}{M_{\text {solvent }}}=9$
So $\quad$ Ans is $=9$
11. Correct order: $\underset{(+5)}{\mathrm{H}_{3} \mathrm{PO}_{4}}>\underset{(+4)}{\mathrm{H}_{4} \mathrm{P}_{2} \mathrm{O}_{6}}>\underset{(+3)}{\mathrm{H}_{3} \mathrm{PO}_{3}}>\underset{(+1)}{\mathrm{H}_{3} \mathrm{PO}_{2}}$
12. Mole fraction of urea in aqueous solution $=0.05$

Let number of moles of solution is $=1 \mathrm{~mole}$

|  | Mole | Mass | Volume |
| :--- | :--- | :--- | :--- |
| Solute | 0.05 | 3 g |  |
| Solvent | 0.95 | 17.1 g |  |
| Solution | 1 | 20.1 g | $20.1 / 1.2 \mathrm{~cm}^{3}$ |

Molarity $=\frac{\mathrm{n}_{\text {solute }}}{\mathrm{V}_{\text {solution (inmL) }}} \times 1000=\frac{0.05 \times 1.2}{20.1} \times 1000=\frac{60}{20.1}=2.985$
Answer after rounding off $=2.98$
Answer after truncation $=2.98$

$5 \mathrm{~L} \quad 25 \mathrm{~L}$
Since volumes are measured at constant $T$ \& $P$
So, $\quad$ Volume $\propto$ mole

$$
n_{\text {akkane }}=\left(\frac{3 n+1}{2}\right) \times n_{\mathrm{O}_{2}}

$$
